The Vein Center Laser Treatment & MedSpa offers new radiofrequency technology

Sartell, Minn. – The first in the state to offer it, The Vein Center Laser Treatment & MedSpa offers a new innovative technology that is more expedient, economical and easier to navigate intravenously. Venclose Radiofrequency System empowers providers to provide high-capacity, optimal and simplified vein procedures. Innovations include two heating lengths in a smaller catheter sheath to minimize invasiveness and enable smaller incisions. Improved navigational features and improvisations for physician convenience allow for greater precision and increased focus on the patient.

The original technology for vein ligation and stripping was developed a decade ago or more, with minimal new technological iterations to the product. A group of Silicon Valley medical innovators and consultants formed Venclose to address the gaps faced by physicians. Development began in 2014 for the next-generation tool to close damaged veins and restore healthy blood flow in patients. In the first full year of commercialization Venclose treated almost 17,000 patients. “Having the best tools on the market allow us to meet our mission to provide beautiful results.” says Dr. Jody Bolton-Smith.

Offering safe, fast and effective procedures for the full spectrum of medical and cosmetic vein treatment, The Vein Center has provided customized and comprehensive vein care to Central Minnesota for more than 11 years.
